The Autosoft FLEX DMS Parts module has features just for General Motors dealers that allow you to track your service lane parts. Each service lane part will be flagged in the master inventory record. The system will identify these parts when you enter a part number on the Master Inventory or Queries screen. You can also generate a parts report for just the service lane parts to identify the parts and to view the inventory totals for just these parts.

Tip: You will need to update the price tape to your inventory again in order for the changes in the price tape for the GM service lane parts to take effect. Update the tape to your inventory using the **Update Manufacturer's Price Tape** option on the Price Tape Update menu.

Flagging Service Lane Parts

The GM Parts Price Tape will identify the service lane parts. The AutoSoft system will flag these parts on the Supplemental Parts screen by placing a **Y** in the **GM Service Lane Parts** field.

Identifying Service Lane Parts

When type a service lane part number on the Master Inventory or Queries screen, the **Part Number** field will turn yellow to indicate this is a service lane part. This helps you quickly identify these parts. This is especially useful on the Queries screen because service lane parts will affect your RIM orders since they have higher stocking requirements due to their sales rate.

Generating the Service Lane Report

The Miscellaneous Parts Reports menu has a Service Lane report. This report identifies all the service lane parts in your inventory and the cost for these parts.

1. Click **Reports**.
2. Click **Miscellaneous Reports**.
3. Click **Service Lane Parts**.
4. Select your print criteria.
